## Problem 1 (30 points)

### 1 (5 points)

Offset: 5 bits, thus the block size is  $2^5$  = 32 bytes = 8 words

### 2 (5 points)

Index: 5 bits, thus number of entries =  $2^5=32$ 

### 3 (5 points)

Consider one block:

The cache has valid bit, dirty bit and reference bit.

$$(32 * 8 + 22 + 3)/(32 * 8) = 1.098$$

#### 4 (5 points)

Address	0	4	16	132	232	160	1024	30	140	3100	180	2180
Index	0	0	0	4	7	5	0	0	4	0	5	4
Tag	0	0	0	0	0	0	1	0	0	3	0	2
Hit/Miss	M	Н	Н	M	M	M	M	M	Н	M	Н	M
Replace	N	N	N	N	N	N	Y	Y	N	Y	N	Y

Index=number of block in cache
=[block address/block size] mod (number of entries)

Tag = [block address/block size] /(number of entries)

4 blocks are replaced

## **5 (5 points)**

Hit ratio = 4/12=0.33

## 3 (5 points)

Since this cache is fully associative and has one-word blocks, the word address is equivalent to the tag. The only possible way for there to be a hit is a repeated reference to the same word, which doesn't occur for this sequence.

Index: no bits to represent index

Tag: 31-0

#### 5 (10 points)

Main memory access=200cycle

• Only first level cache:

CPI=1.5+200\*0.07=15.5

• A second level direct-mapped cache:

CPI=1.5+12\*0.07+200\*0.035=9.34

• A second level eight-way set cache:

CPI=1.5+28\*0.07+200\*0.015=6.46

评分标准:2.1-2.4每题5分,如果把word address当成了byte address但计算正确扣一半的分(-10分)。2.5单个结果错误扣3分

## Problem 3 (15 points)

#### 1 (5 points)

Assume that number of parity bit = p, and number of data bits = d. So there are p + d bit word:  $2^p>=p+d+1$ 

and we get  $p \ge 8$ , we need 8 bits parity bit for single error correcting.

Considering double error detecting, we need another parity bit for checking all bits. Therefore, the minimum number of parity bits required to protect a 128-bit word using the SEC/DED code is 8+1=9.

评分标准:回答出8 bits parity bit for single error correcting(2分),回答出正确的9 bits结果(3分)

### Problem 4 (25 points)

#### 1 (5 points)

Bits 31-12 is virtual memory address.

Bits 11-0 is offset.

#### 2 (15 points)

4669	1	TLB miss,PT miss, PF
2227	0	TLB miss, PT hit
13916	3	TLB hit

## 3 (5 points)

There are two sets, so index takes 1 bit.

Address	Virtual Page	Index	Tag	TLB H/M
4669	1	1	0	TLB miss,PT miss, PF
2227	0	0	0	TLB miss,PT hit
13916	3	1	1	TLB miss,PT hit
34587	8	0	4	TLB miss,PT miss, PF
12608	3	1	1	TLB hit

#### **Final TLB**

Valid	Tag	Physical page number	Index
1	4	14	0
1	0	5	0
1	0	13	1
1	1	6	1

All memory references must be cross referenced against the page table and the TLB allows this to be performed without accessing off-chip memory (in the common case). If there were no TLB, memory access time would increase significantly.

评分标准: 4.2中过程,Final TLB,Final page table各5分,TLB中本身存在的数据各种替换顺序结果均正确。4.3 Final TLB正确4分,回答TLB优势合理1分
